I. INTRODUCTION AND OVERVIEW

Oracle will prove at trial that Google deliberately chose to base its Android software platform on Java technology, seeking to develop and deploy Android rapidly and to capitalize on the large community of Java software developers. Google's documents confirm Google knew it needed a license to do so, and when it could not get one on the terms it wanted, saw two choices: abandon reliance on Java technology and pursue an alternative, or "[d]o Java anyway and defend our decision, perhaps making enemies along the way." (Trial Ex. 7). Google chose to take its chances and push forward with Java, helping itself to Oracle's intellectual property without a license. Oracle will prove at trial that Google's Android software platform infringes (1) Oracle's copyrights in its Java software platform, and (2) six of Oracle's Java-related patents.

The evidence of Google's copyright infringement is overwhelming. To attract Java programmers to Android, Google copied the design specifications of at least 37 application programming interface packages ("APIs") for Java's *core* libraries into Android's core libraries. The designs for those 37 Java APIs, spanning 11,000 printed pages, contain the carefully-wrought architecture for thousands of individual Java class files, methods, and data fields at the core of the Java platform. The API designs detail the relationships and complex interdependencies among these thousands of elements, and contain highly original and creative expression. The 37 APIs that Google copied constitute a substantial and vital chunk of Java's core libraries (37 out of 166 APIs in Java Development Kit Version 5). Furthermore, notwithstanding Google's claim that it developed Android in a "clean room," it also copied proprietary Java source code, object code and comments in 12 software files.

Oracle will ask the Court, after hearing the evidence, to instruct the jury that the API specifications and the copied code are protected by copyright. The Court has already rejected Google's primary argument – that the API specifications are methods of operation – and Google does not contest that software code is copyrightable. A finding of infringement inevitably follows from a determination that the works are protected by copyright, because this is not a case where Google denies access or copying. The lead Android engineers admit they had access to the Java API specifications and deliberately copied them into Android. Google's copyright expert also

26

27 28 acknowledges that Android copies the names and organization of the APIs. And Google does not dispute copying the 12 source code files. The only issue will be whether the copying is justified under Google's affirmative defenses.

The evidence of Google's patent infringement is equally strong. Google chose to model Android on the key features of the Java software platform and development environment. As a result, Android faced many of the same technical challenges that Oracle did with Java and, not surprisingly, adopted many of the same technical solutions to those problems. Some of the most important of those solutions are the subject of the six Java-related patents.

Oracle will rely in large part on the Android source code to prove that the accused functionalities infringe each of the asserted claims. In addition, it will show that in blog postings and public presentations, the Android engineers discussed in detail the features of Android that are covered by the six Java-related patents, often in language that directly tracks the patent claims. Similarly, Google engineers' comments in the Android source code confirm that the patented features are included in Android.

Google's infringement was willful from the very beginning. Internal Google e-mails dating from as far back as 2005 all the way to 2010, just before this lawsuit was filed, are replete with references to the use of Java technology in Android, the need for a license, affirmative acts of concealment, and the likelihood of infringement. Indeed, even after Oracle's legal team presented patent infringement charts to Google's lawyers on July 20, 2010, Google continued to make Android available on its website and even created new versions of the platform. Management repeatedly signed off on Android releases notwithstanding Oracle's patent assertions. Google proffers no advice of counsel or other analysis to defend its conduct.

Google's damages expert says that Android is losing money. But the truth is that Android is wildly successful, and is one of the most popular technology products in the world today. 550,000 new Android devices are activated every day. Google Chairman Eric Schmidt has publicly touted Android's profitability, telling the market that Android revenues are "enough to pay for all of the Android activities and a whole bunch more." Recent Google financial estimates note that Android will directly generate over \$3 billion in advertising revenue and \$2 billion in

gross profits through 2013, with far more in the several years after that. Moreover, Google's own documents show this is just the tip of the iceberg of Android's value to Google. Google's use of Java technology enabled Google to bring Android to market quickly, and ensured that archrivals Microsoft and Apple would not be able to "block" Google from the increasingly critical market for mobile search and other mobile applications. Google estimates that the real value of Android could eventually become up to \$10 billion per year.

Google's success has come at Oracle's expense. Of course, Google must pay for the right to use Oracle's intellectual property. But Oracle has suffered harm far beyond a lost license fee. By incorporating the specific copyrighted works and patented inventions into Android and giving Android away for free, Google has undermined Oracle's ability to license Java to wireless device manufacturers. Sun was forced to abandon its project for a Java-based smartphone software stack in the wake of Android's launch, realizing that there was no way to compete with a free product. Worse still, because Android exploits Java but is not fully compatible with it, Android represents Sun's, and now Oracle's, nightmare: an incompatible forking of the Java platform, which undermines the fundamental "write once, run anywhere" premise of Java that is so critical to its value and appeal. Oracle, as the owner and steward of the Java platform, has a vested interest in avoiding platform fragmentation and facilitating an active Java developer community. Google is fully aware of the importance of preventing fragmentation. Ironically, one of the reasons that Google chose to build its platform on Java was its lack of fragmentation. And Google itself imposes licensing terms on Android that forbid OEMs and other licensees from fragmenting Android in exactly the way it has fragmented Java. The harm from this continued fragmentation, from a product that is rapidly becoming one of the most widespread operating systems in the world, is irreparable and beyond quantification. Oracle will ask the Court to issue an injunction after the trial unless Google agrees to take immediate steps to remedy the fragmentation that has already occurred, and further agrees that the fragmentation will stop.

II. BACKGROUND OF JAVA AND ANDROID

A. Oracle and Java

On January 27, 2010, Oracle Corp. acquired Sun Microsystems, Inc., merged it into Oracle USA, Inc., a wholly owned subsidiary of Oracle Corp., and renamed it Oracle America, Inc. ("Oracle"). One of the most important Sun technologies Oracle acquired was the Java platform and associated intellectual property. After licensing negotiations between Oracle and Google failed (and following several years of unsuccessful licensing discussions between Sun and Google), Oracle filed this complaint against Google on August 12, 2010.

The Java platform is a bundle of programs, specifications, reference implementations, and developer tools that allow developers to write applications in the Java programming language and device manufacturers and users to deploy those applications on servers, desktops, mobile devices, and other devices. Java was designed to achieve "write once, run anywhere" capability, a goal that it achieved, as evidenced by its widespread adoption in the computer programming community. The fundamental idea is that a software developer writes application source code using the Java programming language, compiles it once into an intermediate form known as Java "bytecode," and distributes the bytecode to users. Users' computers are configured with a pre-installed Java "virtual machine" or "JVM" that was written for the user's particular computer architecture. The Java bytecode application executes "on top" of the JVM. The JVM presents a consistent interface to the bytecode application programs, so the same application bytecode can run on any computer that has a JVM. This means application developers only have to write their source code once, and it can run on any device containing a JVM, instead of writing a different version compatible with each device.

Interposing a virtual machine between the application code and the machine created significant technical challenges. Sun's engineers developed new technologies that overcame those challenges. Among other things, they developed enhancements to improve performance speed and efficient memory usage in mobile devices. They also innovated in the area of security to address the many sources of Java programs available over the Internet. These efforts have

resulted hundreds of Java-related patents, including the six Java-related patents asserted in this case.

The Java class libraries that Sun developed are important components of the Java platform. The class libraries help application developers program more efficiently by supplying pre-written code for various applications, thereby obviating the need to write such code from scratch. The APIs are the blueprints to the class libraries, providing not just the names and hierarchical structure of thousands of elements (classes and "interfaces" and associated methods and data "fields"), but also the interdependencies among the various elements and the extent to which they are exposed to one another. Long-time Java programmers have come to expect Sun's

particular API designs and class libraries to be present in Java-based platforms.

Oracle estimates that the Java platform has attracted more than 6.5 million software developers, and that more than 1.1 billion desktop computers and 3 billion mobile phones run Java. Oracle distributes the Java platform under a variety of licensing terms, all of which share one common goal: protecting compatibility and thereby ensuring "write once, run anywhere." This is the core value proposition for application developers and the bedrock of a positive feedback loop that drives Java's success. As the Java website explains: "A marketplace flooded with proprietary code that varies from the official specification, or worse, parallel platform versions, would 'fork' the platform, eliminating its basic 'Write Once, Run Anywhere' compatibility foundation." Oracle, and Sun before it, has gone to great lengths to prevent incompatible forks.

В. Google and Android

The Android operating system software "stack" consists of applications written in the Java programming language, a Java-based application framework, and Java core class libraries, all running on a "Dalvik" virtual machine (Android's version of the JVM). Android first compiles Java application source code into Java bytecode, and then transforms the Java bytecode into Android bytecode known as "DEX."

From the very beginning, Google built Android to be a Java operating system. Google knew that it had no effective alternatives if it wished to develop and offer a mobile platform

8 Mat

quickly that would appeal to users and application developers on whose efforts the competitive success of a platform depends.

Google invites Android application developers to program in the Java programming language using the Android software development kit ("SDK"). The Android SDK provides the tools and APIs necessary to develop applications on the Android platform using the Java programming language. Google also makes available Java "class library APIs," which are aspects of the Java programming interface. Google's expert testified that, once it chose to base its platform on Java, Google was "practically required" to include these APIs.

Because the output of Android software developers is not Java bytecode but Android's DEX bytecode, Android applications cannot run on Java virtual machines even though originally written in the Java programming language. This disrupts the Java ecosystem and destroys the write-once/run-anywhere paradigm that drove Java's acceptance. Android thus represents the highly injurious fragmentation of Java that Sun and Oracle have worked assiduously to prevent.

Google developed Android with the expectation that it would be widely adopted and profitable for Google by: (1) generating significant advertising revenue streams from Google search and other Google applications on Android devices; and (2) reinforcing Google's dominant position in search and advertisements by ensuring its access to and position in the increasingly important mobile marketplace. Google believed it was critical to bring its Android mobile platform to market quickly, fearing dramatic decline if it failed to do so. (Trial Ex. 370 ("if we miss the 'mobile window', we'll be out of business in 10 years").

III. GOOGLE'S COPYRIGHT INFRINGEMENT

A. Direct Copyright Infringement

Oracle will prove that Google is liable for copyright infringement based on Google's substantial copying of 37 API design specifications from Java's *core* libraries, and software code from Oracle's Java software platform.

To prevail on copyright infringement, Oracle must show that: (1) it owns the copyrights; and (2) Google copied original elements of the copyrighted APIs and code. *Jada Toys, Inc. v. Mattel, Inc.*, 518 F.3d 628, 637-38 (9th Cir. 2008). Oracle's Java-related works at issue in this

28

case are registered with the Copyright Office, establishing Oracle's ownership of the copyrightsin-suit. Google does not deny that it copied the API specifications and source code.

In developing Android, Google employees and contractors deliberately copied the 37 Java API design specifications, containing the fundamental structure for much of the Java core class libraries. The "core" libraries are at the heart of the Java platform, providing foundational support for all applications running on the JVM. These APIs had been carefully and painstakingly designed by Sun engineers. Designing APIs for a complex modern software platform like Java is a highly creative, intellectually demanding endeavor. Google's own expert acknowledged that designing APIs "certainly has creative elements" and he testified that: "[W]e've been writing software for more than 50 years. And it's still incredibly difficult, despite all the advances that have been made in languages, in libraries, APIs are one of the things, although they're not software, they're related to software that it's still hard to do." In the words of Google engineer and API designer Joshua Bloch, who formerly worked for Sun and designed many of the APIs at issue, "API design is an art, not a science." Oracle will present evidence at trial showing the many different and complex expressive choices that were made in designing the Java APIs. This design is set forth in the API specifications themselves and is incorporated into the Java source code that implements them.

Google engineers have admitted to consulting the Java API design specifications while designing Android. Former Google engineer Robert Lee was the lead core library developer for Android. He testified that he was tasked to "implement core libraries according to the Java APIs." To this end, Google copied the 37 core Java API specifications into the Android API specifications, and incorporated the Java API specifications and their design into the Android source code, creating derivative works. Mr. Lee acknowledged that he and other Android developers had access to Sun's Java API specifications. Google engineers also testified that they based some of Android on code obtained from the Apache Software Foundation's implementation of Java known as "Harmony." But Google was well aware that the Harmony version of Java was not licensed for use in mobile phones. This was the topic of a widely publicized dispute between Sun and Apache. Google knew it should not have been copying from Harmony for Android.

And even if this were not the case, Google cannot excuse its copyright infringement by claiming that it copied from a third party, even if it thought the party was licensed. *Pye v. Mitchell*, 574 F.2d 476, 481 (9th Cir. 1978).

Android engineers also directly copied source code into Android from 11 Java code files into 12 files of its own. While working at Sun, former Sun engineer Joshua Bloch wrote the code for the Java method "rangeCheck." He subsequently went to work for Google, where he copied that very same code into Android. Google also copied object code for eight other Java files, decompiled it to source code, and copied the source code from the file into Android. Google copied significant portions of comments from two additional files. The evidence of this copying is compelling, and Google has never attempted to deny it.

B. Indirect Copyright Infringement

Under Ninth Circuit law, as a consequence of Google's *direct* infringement, Oracle is entitled to recover profits Google received from the further copying and exploitation of its infringing work by others in the United States or abroad. *L.A. News Serv. v. Reuters Tv Int'l*, 340 F.3d 926, 931-32 (9th Cir. 2003). Google is liable for indirect copyright infringement as well, based on the direct infringement of mobile device manufacturers, carriers and developers.

Google is liable for contributory infringement. To prove contributory infringement, Oracle must show that: (1) Google knew or had reason to know of the infringing activity of others; and (2) Google intentionally or materially contributed to the infringing activity of others. *Louis Vuitton Malletier, S.A. v. Akanoc Solutions, Inc.*, No. 10-15909, No. 10-16015 2011 U.S. App. LEXIS 18815, at *12-15 (9th Cir. Sept. 9, 2011).

The Ninth Circuit recently addressed the question of contributory copyright infringement in *Louis Vuitton*. It held that: "Material contribution turns on whether the activity in question 'substantially assists' direct infringement." *Id.* at *13 (citation omitted). The Ninth Circuit found there was contributory infringement in the *Louis Vuitton* case because the defendant's hosting of servers was "an essential step in the infringement process." *Id.* at *13-14 (citation omitted). Google "substantially assisted" the direct infringement of mobile device companies (OEMs), carriers, and developers by distributing infringing copies of Android source code and binary code

by making it available to them for download. Google requires its OEMs to maintain the full set of Android APIs in Android devices — including the 37 core APIs it copied from Oracle — to prevent fragmentation of the Android platform. Google's Android "anti-fragmentation" license provides that "[d]evice implementations MUST NOT omit any managed APIs," and "MUST NOT modify the publicly exposed APIs on the Android platform" and "MUST NOT add any publicly exposed elements . . . to the APIs." (emphasis in original). The infringing code was copied by mobile device manufacturers, and distributed by these manufacturers and carriers who sold the Android mobile devices that contain them. Google also does not dispute that the "rangeCheck" program that engineer Joshua Bloch copied from Oracle has been included on many generations of Android devices, and so has been copied and distributed as well. Developers copy the infringing code from Google's website when they download the Android SDK, as Google requires, to do their development work. Each of these activities is an "essential step" in the infringement process and thus Google is liable for contributory infringement. 14 The Ninth Circuit emphasized in *Louis Vuitton* that no finding of intent is required for

contributory copyright infringement: "We have never held that an express finding of intent is necessary to support liability for contributory copyright infringement. To the contrary, we have held that 'intent may be imputed' as a result of 'a service provider's knowing failure to prevent infringing actions." Id at *12-13 (quoting Perfect 10, Inc. v. Amazon.com, 508 F.3d 1146, 1172) (9th Cir. 2007)). Here, Google not only failed to prevent infringing actions – it actively encouraged them.

Google is similarly liable for vicarious infringement. To prove vicarious infringement, Oracle must show that: (1) Google profited directly from the infringing activity of the mobile device manufacturers, application developers, and end-users; (2) Google had the right and ability to supervise and control the infringing activity of those parties; and (3) Google failed to exercise that right and ability. MDY Indus., LLC v. Blizzard Entm't, Inc., Nos. 09-15932, 09-16044, 2011 U.S. App. LEXIS 3428, at *10 (9th Cir. Feb. 17, 2011). Google is profiting to the tune of hundreds of millions in dollars in advertising revenue alone based on this infringing activity. The Android licenses, with their anti-fragmentation requirements, prove that Google had the "right

and ability to supervise and control the infringing activity." Google not only failed to stop the

infringing activity, Google actually *requires* it.

IV. GOOGLE'S PATENT INFRINGEMENT

A. Direct Patent Infringement

5 mal 7 SDD 8 con 9 trip 10 diff 11 infr 12 infr 13 And 14 of t 15 occ

Oracle will prove that Google has directly infringed the six Java-related patents by making, using, offering to sell, selling, or importing devices running Android or the Android SDK. The 26 asserted claims of the six Java-related patents include method, apparatus, and computer-readable medium claims. Many of the asserted claims can be grouped into pairs or triples, with each claim in the group having the same technical substance, but drafted as a different type (method, apparatus, or CRM). Google's Android software is the linchpin of the infringement of each type of claim. Installing Android software on a device creates a system that infringes apparatus claims, using the Android device infringes the method claims, and the Android device's storage media infringes the computer-readable media claim. Similarly, for two of the patents (the '702 and '520), infringement of the apparatus, method, and CRM claims occurs, respectively, through installation, use, and storage of the Android SDK on a computer to write Android applications. In each case, infringement arises from meeting identical limitations in all of the claim types.

To prevail on direct infringement, Oracle must show that Android, or the use of Android, satisfies each and every requirement of the asserted claims. *Uniloc USA, Inc. v. Microsoft Corp.*, 632 F.3d 1292, 1301 (Fed. Cir. 2011). Oracle's evidence of Google's infringement will include (1) a detailed analysis of Android source code performed by Oracle's experts, (2) the testimony of Google engineers who developed Android, and (3) numerous comments in the Android source code, Google e-mails, blog postings, and public presentations describing the infringing Android functionality in a manner that often directly tracks the claim language.

Separately and together, the six Java-related patents cover innovations that are crucial to the viability of Android's virtual-machine-based architecture. The internal e-mails among the Android developers reveal that the Java virtual machine was essential to Android: e.g., "The JVM is going to be a central piece of the system we're building, not some little add-on on the side

– so we can provide some really good java application development and user experiences." (Google engineer Brian Swetland, Trial Ex. 7). The six Java-related patents cover features designed to enhance performance speed and memory efficiency of the Java virtual machine, as well as provide a robust security framework:

Reissue Patent No. RE38,104. This patent covers systems and methods for resolving "symbolic references" (i.e., name references in bytecode for classes, methods, fields, or strings) into numerical references (references by memory location). Oracle will show that the asserted claims are infringed by Android's Dalvik virtual machine and dexopt software, both of which resolve symbolic references in the bytecode into numeric references indicating memory locations.

Patent No. 6,910,205. This patent increases the execution speed of bytecode instructions by modifying them to represent or reference "native" machine instructions. Oracle will show that the asserted claims are infringed by Android's dexopt software and Just-In-Time compiler, both of which translate certain bytecode instructions into new instructions that reference or represent native code.

Patent No. 5,966,702. This patent saves memory space by removing from individual class files certain code and data that are redundant across multiple class files and placing them in a "shared constant pool table." The resulting "reduced class files" are packaged together in a multi-class file. Oracle will show that the asserted claims are infringed by Android's dx tool, which pre-processes class files to identify and remove duplicated constant pool entries, places them into a shared table, and forms a multiclass file of reduced class files and the shared table.

Patent No. 7,426,720. The asserted claims relate to a method for improving application startup time and preserving memory space by running applications in separate virtual machines created using a "copy-on-write" cloning mechanism. Application programs share a memory space until one needs to "write" to that space, at which point, a copy of that space is made, thus minimizing the amount of memory needed. Oracle will show that the asserted claims are infringed by Android's zygote software, which clones a child Dalvik virtual machine from a master Dalvik virtual machine for each new application launched using a copy-on-write cloning

mechanism that defers copying of the shared memory space until a process attempts to write to a portion of the shared memory space.

Patent No. 6,061,520. The claimed invention simulates or "play executes" a program to create a reduced number of instructions to perform the same operation. Oracle will show that the asserted claims are infringed in part by Android's dx tool, which simulates execution of bytecode to identify the static initialization of an array.

Patent No. 6,192,476. The claimed invention provides a security mechanism in which objects are allowed to perform only the actions specified in the "protection domains" associated with their classes. Although Google claims that Android does not use the Java security mechanism, the infringing code was indisputably included in all Android versions prior to the most recent release, allowing Android implementers the option of utilizing the Java security framework.

The evidence of Google's infringement will not be difficult for a jury to follow, as it includes comments in Google documentation describing Android's features in language that plainly tracks the patent claims. For instance, engineer comments in the Android source code show that Android resolves "symbolic references" (the term used in the '104 patent claims) into memory location references, infringing the '104 patent:

/*

- * Link (prepare and **resolve**). Verification is deferred until later.
- * This converts symbolic references into pointers. It's independent of
- * the source file format.

(Comments for "dvmLinkClass" routine in dalvik\vm\oo\Class.c)

Similarly, internal Google documents reveal that Android includes a "shared constant pool" (the claim language of the '702 patent) for storing redundant items from multiple class files, infringing the '702 patent: "In-memory compactness is aided by having a **shared constant pool** for a set of classes (rather than one constant pool per class)." (Android Product Requirements, Trial Ex. 141).

16 17

15

18 19

20 21 22

23

24 25

26

27

Google's own technical descriptions of Android show the substantial benefits of the patented features to the speed and memory efficiency of Android devices. For example, in a public video, Google engineer Dan Bornstein discussed the performance benefits of symbolic reference resolution, the technology of Oracle's '104 patent:

We do optimization. . . . we have a bunch of other things that we do such that when, when it comes time to run, we can run that much faster. So as an example of static linking, before, when, when a dex files arrives on a, on a device it will have symbolic references to methods and fields, but afterwards it might just be a simple, a simple integer v-table offset.

(Google I/O Android Video on "Dalvik Virtual Machine Internals" by Dan Bornstein (2008).)

The performance benefits of the patented features were confirmed through performance tests conducted by Oracle's experts. In summary, the tests showed that the patented features substantially increase application execution speed on Android devices (as much as 13 times faster for some of the patented features), and save memory by as much as 40%, which ultimately prolongs battery life. A survey conducted by another Oracle expert demonstrates user demand for faster application launch times and greater multitasking capability, characteristics enhanced by the patented inventions.

В. **Indirect Patent Infringement**

Oracle will prove that Google has contributed to infringement by mobile device manufacturers, mobile service providers, developers, and end-users of Android, and actively induced them to infringe the asserted claims. To prevail on contributory infringement, Oracle must show that: (1) Google supplied an important component of the infringing part of the product; (2) the component is not a common component suitable for non-infringing use; and (3) Google supplied the component with knowledge of the Java-related patents (or having willfully blinded itself to their existence) and knowledge that the component was especially made or adapted for use in an infringing manner. Aro Mfg. Co. v. Convertible Top Replacement Co., 377 U.S. 476, 487-93 (1964); DSU Med. Corp. v. JMS Co., 471 F.3d 1293, 1303 (Fed. Cir. 2006) (en banc).

To prevail on active inducement, Oracle must show that: (1) Google took action intending to cause acts by purchasers, licensees, and users of Android; (2) Google was aware of the six Java-related patents (or had willfully blinded itself to their existence) and knew or should have known that the acts, if taken, would constitute infringement of those patents; and (3) the acts were actually carried out by the purchasers, licensees, and users of Android and directly infringed that claim. *DSU Med. Corp*, 471 F.3d at 1304.

Oracle will show that Google has indirectly infringed the asserted claims by distributing the Android platform to mobile device manufacturers, mobile service providers, developers, and

the Android platform to mobile device manufacturers, mobile service providers, developers, and end-users, and encouraging them to use it without modification. Google uses the "Android" trademark and Google proprietary applications as a "carrot" for compliance with Google's detailed compatibility requirements for Android devices. Among other things, Google's Compatibility Definition Document prohibits most changes to the Java APIs within Android ("Device implementations MUST NOT modify the publicly exposed APIs on the Android platform by changing any method or class signatures"), and prohibits or discourages changes to the infringing Dalvik virtual machine ("Device implementations MUST support the full Dalvik Executable (DEX) bytecode specification and Dalvik Virtual Machine semantics"). Google also encourages Java programmers to develop Android applications using the infringing Android SDK. The testimony and documents of Google personnel, as well as testimony from a corporate representative of Motorola Mobility (a major Android device maker), will show that Google goes to great lengths to prevent mobile device manufacturers from fragmenting Android, and in doing so, ensures that they do not modify the patented source code features.

1. Google's Willful Blindness

In order to establish the "intent" prong of contributory infringement and infringement by inducement, Oracle need not prove that Google had actual knowledge of the six Java-related patents. Instead, as the Supreme Court recently held in *Global-Tech Appliances, Inc. v. SEB S.A.*, Oracle can establish that Google had the requisite intent by showing that Google took deliberate actions to avoid learning of the Java-related patents. 131 S. Ct. 2060, 2067, 2070-71 (2011).

Google's jury instructions studiously avoid any reference to *Global-Tech's* willful blindness standard, relying instead on model instructions decided four years before.

To prove willful blindness, Oracle must show that: (1) Google subjectively believed that there was a high probability that Oracle had protective patents covering the Java platform; and (2) Google took deliberate actions to avoid learning of that fact. *Global-Tech Appliances*, 131 S. Ct. at 2070-71.

Oracle will show that Google knew Sun had a broad patent portfolio covering the Java platform. Mr. Rubin, the head of Google's Android division, knew that Sun had intellectual property covering Java from as early as 2003, when his company, Danger Inc., took a Java license from Sun. He subsequently negotiated with Sun for a Java license while at Android Inc. and then at Google. In late 2005 and 2006, after Google acquired Android Inc., Sun and Google discussed a collaboration to incorporate Java technology into what became the Android operating system. In 2008, Sun and Google engaged in further discussions. In the spring and summer of 2010, before the filing of this lawsuit in August 2010, Oracle and Google had another series of meetings to discuss a Java license for Android. Rubin testified that given Sun's broad patent portfolio, it would have been impractical to study Sun's patents, and he was aware of no effort to do so. Moreover, in a July 20, 2010 meeting, Oracle presented to Google the six Java-related patents that are now at issue in the lawsuit. Given the history of licensing negotiations between Google and Sun/Oracle, Google cannot deny that it knew Java was subject to intellectual property protection and that Google needed a license to use it.

Furthermore, internal Google documents will show that Mr. Rubin and other Google employees were aware that Sun had Java-related intellectual property rights. And Google hired over one hundred former Sun employees, including four of the inventors of the asserted patents (Lars Bak, Frank Yellin, Robert Griesemer, and James Gosling), several Sun Java engineers who became key Android developers (Joshua Bloch and Tim Lindholm), and Sun's former CTO, Eric Schmidt, who became Google's CEO and Chairman. The inventors were, of course, heavily involved with the development of the Java virtual machine at Sun (Mr. Gosling, in particular, is regarded as the father of the Java platform). Messrs. Bloch and Lindholm were also closely

involved with the JVM (Mr. Lindholm was co-author of the official Sun book on the JVM). And Mr. Schmidt, as Sun's CTO, was intimately familiar with Java. With this large and knowledgeable cast of former Sun personnel in its employ, Google cannot deny that it was aware of Sun's Java intellectual property portfolio and licensing practices. Oracle will show that despite its knowledge of the high probability that Android infringed Sun's Java-related patents, Google made a deliberate choice not to investigate the patents in order to avoid learning of that fact. Google's willful blindness to the existence of the Java-related patents satisfies the "intent" prong of Oracle's indirect infringement claims.

2. Google Cannot Escape Liability By Claiming That Android is Free Google contends that because it ostensibly makes Android available without monetary charge, it cannot be liable under §§ 271(a) or 271(c) for "offer[ing] to sell, or sell[ing]" Android.

Google contends that because it ostensibly makes Android available without monetary charge, it cannot be liable under §§ 271(a) or 271(c) for "offer[ing] to sell, or sell[ing]" Android. But there is no basis for exempting no-charge products from infringement liability under the statute. Google does not contest that it can still be liable under § 271(a) because it "makes" and "uses" Android. Courts have held that giving away a product is a "use" under § 271(a), particularly when the infringer derives economic gain from the product. There is no sound reason why no-charge products liable for direct infringement under § 271(a) should be exempt from contributory infringement under § 271(c). Moreover, Android is not given away free of obligation, as Google requires OEMs to comply with its compatibility requirements if they wish to benefit from use of the Android trademark and Google's Android applications store.

Courts have held that giving away an infringing product without charge is a "use" under § 271(a). *Northbrook Digital, LLC v. Vendio Servs. Inc.*, 625 F. Supp. 2d 728, 754 (D. Minn. 2008) (holding that free software may "use" accused technology and infringe under § 271); *Thorn EMI N. Am., Inc. v. Micron Tech., Inc.*, 821 F. Supp. 272, 275 (D. Del. 1993) ("because delivery of free samples of allegedly infringing samples tangibly impinges on the patentee's monopoly rights in a way that ordinary solicitation does not, such delivery must be regarded as 'use' of an allegedly infringing product for the purposes of § 271(a)"). Liability for the distribution of nocharge products is particularly appropriate where the infringer derives an economic gain from distribution of the product. *See Northbrook*, 625 F. Supp. 2d at 755 n.5 ("Because usage is a

27 28 sufficient theory to establish jurisdiction over the infringement claims here, it is not necessary to consider whether Vendio derives any other economic gain that may constitute a sale under § 271(a). But there is little question that, even though Vendio distributes Dealio software for free, it does so to its commercial advantage.").

There is no question that Google derives a huge economic benefit from its distribution of Android, including millions of dollars in advertising revenue generated from Android devices. Given the economic gain it derives from Android, it would make no sense to exempt Google's distribution of Android from triggering contributory infringement liability under § 271(c). Google has offered no authorities to support such an exemption.

C. **Google's Invalidity Contentions**

Google's primary defense against Oracle's patent claims is the asserted invalidity of the six Java-related patents, as well as a claim of patent unenforceability due to implied license, laches, estoppel, and waiver. No doubt recognizing the deficiencies of its original invalidity contentions, Google sought leave to supplement those contentions, but the Court mostly denied Google's proffered supplementation as untimely. Google is now left with a narrowed group of invalidity contentions, many of them based on tenuous obviousness assertions.

Oracle will oppose any effort by Google to assert invalidity contentions that it was not granted leave to include in its supplemental contentions. In particular, Google still purports to assert its "printed matter" defense under 35 U.S.C. §§ 101 and 102 against Claim 19 of the '720 patent and Claim 14 of the '476 patent, even though the Court denied Google's request to supplement its contentions to provide further elaboration on this defense. (Dkt. 281 at 7.) This printed matter defense was not timely disclosed and is not properly in the case. Similarly, Google should not be permitted to assert any invalidity grounds not included in its Court-ordered selection of contentions.

V. GOOGLE'S WILLFUL INFRINGEMENT

Willful Infringement Α.

Oracle will prove that Google willfully infringed the copyrights-in-suit and the six Javarelated patents. To prevail on willful copyright infringement, Oracle must show that (1) Google

was actually aware of the infringing actions; or (2) Google's actions were the result of reckless disregard for, or willful blindness to, Oracle's rights. *Louis Vuitton Malletier*, 2011 U.S. App. LEXIS 18815, at *15. To prevail on willful patent infringement, Oracle must show that: (1) Google acted despite a high likelihood that Google's actions infringed a valid and enforceable patent; and (2) Google actually knew or should have known that its actions constituted an unjustifiably high risk of infringing a valid and enforceable patent. *In re Seagate Tech., LLC*, 497 F.3d 1360, 1371 (Fed. Cir. 2007).

Oracle will show that Google knew or willfully blinded itself to the fact that the Java platform is protected by the Java-related copyrights and patents, that Google infringed the copyrights and patents anyway, and that it contributed to and induced others to infringe them as well. There can be no question that Google knew Java was a proprietary technology subject to copyright and patent protection and that it needed a license to use it for Android. As previously described, the history of Java license negotiations in which Mr. Rubin and Google were involved unequivocally demonstrates Google's knowledge. Internal communications at Google reveal that the company was well aware of the need to license Java technology for use in Android, and that it deliberately chose to proceed without a license. And the numerous Sun personnel that Google hired brought with them not only their knowledge of the Java technology, but also their awareness of Sun's Java intellectual property and licensing practices.

Google argues that it cannot be liable for willful infringement prior to the time that it became specifically aware of the six Java-related patents. The parties agree that Oracle presented the six Java-related patents to Google at a meeting on July 20, 2010. Google insists that it had no knowledge of the specific patents prior to that time, and so cannot be liable for willfulness. Google is mistaken on the law.

Federal courts have found that specific knowledge of the patents is not necessarily required to trigger a finding of willful infringement. The Federal Circuit in *Seagate* held that a finding of willfulness requires a showing that "the infringer acted despite an objectively high likelihood that its actions constituted infringement of *a valid patent*." *In re Seagate*, 497 F.3d at 1371 (emphasis added). District courts applying *Seagate* have found that specific knowledge of

the patents is not required if the infringers had enough information that they knew or *should have known* their actions constituted an unjustifiably high risk of infringing a valid patent. *Krippelz v. Ford Motor Co.*, 636 F. Supp. 2d 669, 671, n.2 (N.D. Ill. 2009) ("Knowledge of [a] patent is not the same thing as knowledge of the high likelihood that one's actions constituted infringement of a valid patent"); *PalTalk Holdings, Inc. v. Microsoft Corp.*, No. 2:06-CV-367 (DF), 2009 U.S. Dist. LEXIS 131087, at *6-7 (E.D. Tex. Feb. 2, 2009). In *PalTalk*, the court held that "knowledge may be actual or constructive." *Id.* at 5. The patentee in that case identified information in the defendant's possession that demonstrated the defendant's awareness of both "the innovative characteristics of [patentee's] technology and [its] development of a patent portfolio." *Id.* at 6-7. The court held that "[a] reasonable jury could find based on the direct and circumstantial evidence presented that [defendant] had actual knowledge of the patents-in-suit." *Id.* at 7.

Given all of the information that Google possessed regarding Sun's Java intellectual property and the need to obtain a license for Java, Oracle will be able to demonstrate that Google willfully infringed the six Java-related patents both before and after the July 20, 2010 meeting.

B. Willful Infringement as Part of the Liability Phase of Trial

If this Court bifurcates the trial into liability and damages phases, the issue of willful infringement should be tried during the liability phase. There is a significant overlap between the evidence proving infringement and willful infringement. For example, numerous internal Google documents on Android's architecture also discuss aspects of the Java platform and reveal Google's knowledge of the need to take a Java license. Oracle also intends to examine the same Google witnesses for both infringement and willful infringement.

The evidence of willful infringement is relevant to other issues that the jury must decide in the liability phase as well. Oracle asserts that Google is liable for both direct and indirect infringement of the Oracle patents. While the parties do not agree on the instructions for willfulness or indirect infringement, they do agree that both require proof of knowledge and intent.

Further, Google is asserting equitable defenses to infringement. Google has failed to articulate factual bases for these defenses, but if Google is allowed to present them during the liability phase, Google's evidence and Oracle's in response will bear directly on the issue of willfulness. *See Haworth, Inc. v. Herman Miller, Inc.*, No. 1:92CV877, 1993 WL 761974, at *3-4 (W.D. Mich. July 20, 1993) (willfulness to be tried in liability phase along with defendant's equitable defenses since proof of willful infringement could provide a basis for the plaintiff to negate the defendant's equitable defenses); *Wang Labs., Inc. v. Mitsubishi Elecs. Am., Inc.*, No. CV 92-4698 JGD, 1994 WL 471414, at *2 (C.D. Cal. Mar. 3, 1994), *aff'd on other grounds*, 103 F.3d 1571 (Fed. Cir. 1997) (willfulness bears on equitable estoppel defense and thus should be tried with liability).

These closely related issues would become intertwined at trial. *See Kos Pharms., Inc. v. Barr Labs., Inc.*, 218 F.R.D. 387, 393 (S.D. N.Y. 2003) ("questions regarding infringement and willfulness cannot always be neatly disaggregated into distinct evidentiary foundations grounded on entirely different witnesses and documents"); *THK Am., Inc. v. NSK Co. Ltd.*, 151 F.R.D. 625, 629 (N.D. Ill. 1993) ("A willfulness determination . . . is a finding of fact inextricably bound to the facts underlying the alleged infringement."). If the issue of willful infringement is left for the damages phase, Oracle will need to present much of the same evidence again. Accordingly, trying both infringement and willful infringement issues during the liability phase would promote judicial efficiency, conserve judicial resources, and respect the time commitment asked of the jurors.

VI. COPYRIGHT AND PATENT DAMAGES

Oracle seeks damages for both copyright infringement and patent infringement independently. For both copyright and patent infringement, Oracle seeks damages measured as a reasonable royalty for the infringement. For copyright, Oracle will also offer evidence on an alternative measure of damages, lost profits, as well as evidence of Google's profits attributable to the infringement to the extent not included in the royalty or lost profits. Oracle contends that it is entitled to treble damages based on Google's willful infringement of its patents, and that

24

25

26

27

28

Google may not be able to deduct certain of its overhead costs if the jury finds that it deliberately plagiarized Oracle's copyrights.

A "reasonable royalty" is calculated based on a hypothetical license negotiation as of the date infringement began. See Lucent Techs., Inc. v. Gateway, Inc., 580 F.3d 1301, 1324-25 (Fed. Cir. 2009). The hypothetical license would allow use of the infringed intellectual property in exactly the way Google has used it: to create a mobile platform based on Java technology that is incompatible with Oracle's Java platform and provides Google with two important benefits – a pre-existing base of application developers and platform independence crucial to ensuring that it continues to be the dominant provider of search and advertising on the Internet. In calculating a reasonable royalty, key considerations will be the substantial losses that Sun anticipated as a result of Android and the enormous gains that Google expected (and, in fact, has earned and will earn) from Android.

A. **Damages for Patent Infringement**

Following the methodology prescribed by the Court in its July 22, 2011 Order and the case law (including Georgia Pacific), Oracle's damages expert calculated damages from patent infringement based on an assessment of a reasonable royalty arising from a hypothetical negotiation for a license that would enable Google's use of the specific infringed intellectual property. To do so, the expert identified a reasonable starting point royalty, based on the actual negotiations between the parties in 2005 and 2006 and the nature of the license that Google assumed. As suggested by the Court, Oracle's damages expert used \$100 million as an appropriate "starting point."

Following the Court's direction, Oracle's damages expert next determined that substantial upward adjustments are warranted to reflect the "use made of the invention by the infringer." See 35 U.S.C. § 284; Georgia-Pacific Corp. v. U.S. Plywood Corp., 318 F. Supp. 1116 (S.D.N.Y. 1970). The actual-world negotiations between Sun and Google contemplated a license that would have guaranteed Android's compliance with Java's compatibility test kit ("TCK compliance") and overall compatibility with Sun's Java platform, thereby providing Sun substantial benefits in the form of convoyed sales (such as additional fees for customized source code) and further

24

25 26

27

28

platform momentum, whereas the hypothetical license for use of Sun's Java IP to create Android in the *incompatible* form in which it exists today eliminated these benefits and fragmented Java technology.

Oracle's expert then used the opinions of technical experts, industry performance benchmarks, economic data, a consumer survey, detailed statistical analyses, and Google's own documents to determine the contributions of the particular infringed patents relative to the "starting point," adjusting downward as a result. He further apportioned to limit damages to the consequences of infringing acts performed within the United States, and concluded that a reasonable royalty for the patents-in-suit, taken together and based only on those elements that he was able to quantify is approximately \$202 million through December 2011. He did not include the substantial, but irreparable and unquantifiable harm from fragmentation in this figure.

Consistent with the Court's guidance that Oracle should also address the assumption that an injunction may not be entered, Oracle's damages expert also noted that annual future damages will likely be significantly higher than annual past damages because of the finding of liability, changed market circumstances since the time of the original hypothetical negotiation, and the growing significance of fragmentation as Android increasingly penetrates multiple markets. Using the structure of the original hypothetical license, patent damages for 2012 alone would be approximately \$200 million.

В. **Damages for Copyright Infringement**

As damages for Google's copyright infringement, Oracle is entitled to recover the actual damages that Oracle suffered as a result of the infringement, and any of Google's profits that are attributable to the infringement and are not taken into account in computing the actual damages 17 U.S.C.A. § 504.

With respect to actual damages for copyright infringement, Oracle's expert first calculated actual damages as a reasonable royalty, using much the same approach as for patent damages. See Polar Bear Prods., Inc. v. Timex Corp., 384 F.3d 700, 707-08 (9th Cir. 2004). The value of the copyright hypothetical license is \$102.6 million. As an alternative measure of actual damages, Oracle's expert calculated Oracle's lost profits, which are also significant. Oracle has

suffered reductions in its Java licensing revenue to mobile device and other manufacturers, as well as lost profits from revenue it had projected to earn from the Java-based smartphone platform development project that it discontinued because Google released an infringing, incompatible Android for free. Actual damages measured as lost profits are \$136.2 million.

Oracle's expert also analyzed Google's infringer's profits. On this issue, it is Google's burden to prove its deductible expenses and to demonstrate the portion of its profits that is not attributable to the infringed APIs, which even its own copyright expert recognizes "are necessary for functionality, interoperability and programming efficiency." Infringer's profits are already substantial and will be immense in the future. Although Google's damages expert offered no independent apportionment analysis of his own, if the jury accepts that Google has carried its burden on apportionment, Oracle's damages expert calculates past damages as infringer's profits of \$61.3 million; going forward, they could be in the hundreds of millions of dollars for 2012 alone.

VII. ISSUES TO BE DECIDED BY THE COURT

Several important issues of law should be decided by the Court after hearing the evidence at trial. The same is true for Google's equitable defenses.

A. Copyrightability of The 37 API Design Specifications and Copied Code

The Court should instruct the jury on the copyrightability of the 37 core API design specifications and the 12 source code files that Google copied. Copyrightability is a question of law for the court. *See Jonathan Browning, Inc. v. Venetian Casino Resort LLC*, No. C 07-03983 JSW, 2009 U.S. Dist. LEXIS 57525, at *2 (N.D. Cal. June 18, 2009) ("Determinations of copyrightability are indeed questions of law reserved for the judge, and not the jury."). The Ninth Circuit has held that the court should determine both copyright protection and its scope. *Apple Computer, Inc. v. Microsoft Corp.*, 35 F.3d 1435, 1443, 1447 (9th Cir. 1994).

However, to the extent there are facts underlying copyrightability these may be for the jury to decide. *See* 3-12 *Nimmer on Copyright* § 12.10[B][1] ("to the extent that the defendant challenges the quantum of plaintiff's originality or creativity as a matter of law, or urges other such legal challenges to copyright subsistence, these matters should be resolved solely by the

judge. But threshold factual determinations in this regard, of course, are for the jury.") In addition, courts in this Circuit recognize that originality is a question of fact. *Dongxiao Yue v. Chordiant Software, Inc.*, No. C-08-00019, 2009 U.S. Dist. LEXIS 118824, at *7 (N.D. Cal. Dec. 21, 2009) ("Whether a work is sufficiently original to warrant copyright protection is a question of fact.") (citing *Dezendorf v. Twentieth Century-Fox Film Corp.*, 99 F.2d 850, 850 (9th Cir. 1938). When there are no genuine issues of fact, originality may be resolved as a matter of law. *Jacobsen v. Katzer*, No. C 06-01905 JSW, 2009 U.S. Dist. LEXIS 115204, at *9-10 (N.D. Cal. Dec. 10, 2009).

In this case, Google purports to raise several factual issues relating to the copyrightability of the APIs. Google contends, for example, that its copying of the APIs was required by "industry demand." Google's Motion for Summary Judgement (Dkt. 260) at 21. It also tries to justify its copying on the grounds of compatibility (*id.* at 19), even though it does not deny that Android fragmented Java and is incompatible with it. Google is also challenging the originality of the 37 API design specifications that it copied. Oracle does not believe that any of these factual challenges are valid. But the Court should consider this evidence as it relates to copyrightability and originality over the course of the trial, and determine if there are any issues of fact for the jury to determine. Oracle believes the Court will conclude, as a matter of law, that the 37 API design specifications are both original and copyrightable.

As described above, the API design specifications set forth a very intricate, and creative design, that contains thousands of different elements and defines the many complex relationships among them. Google cannot raise a serious challenge to the expressive nature of the APIs or their originality. Copyright law protects expression in software design, including the selection and structure of software elements. Courts have recognized the copyrightability of programs with much simpler structures than the Java API design specifications herethan Java. For example, the Tenth Circuit upheld a district court's finding of likelihood of success on copyrightability of the "organization, structure and sequence" of a computer program designed to teach reading skills, including a "keying procedure" that required students to respond by pressing the 1, 2 or 3 keys. *Autoskill, Inc. v. Nat'l Educ. Support Sys., Inc.*, 994 F.2d 1476, 1492, 1495 n.23 (10th Cir. 1993).

Similarly, in *CMAX/Cleveland, Inc. v. UCR, Inc.*, 804 F. Supp. 337, 355 (M.D. Ga. 1992), the court held that the file structures for a software program design for companies in the "rent to own" business constituted copyrightable expression. *See also Eng'g Dynamics, Inc. v. Structural Software, Inc.*, 26 F.3d 1335, 1345-46 (5th Cir. 1994) (rejecting argument that input data formats in structural engineering software program did not contain original expression because they were purportedly "organized in a particular fashion to effectuate the performance of mathematical calculations"). Certainly the API design specifications reflect a far more complex structure and organization than the software in these cases.

Google's main challenge to the copyrightability of the API design specifications was that they are supposedly unprotectable "methods of operation." The Court has already has already rejected this argument on summary judgment, concluding that, "This order finds that the API package specifications at issue are not 'methods of operation' under 17 U.S.C. 102(b)." 9/15/11 Summary Judgment Order (Dkt. 433) at 10-11.

As for the 12 copied source and object code files, Google has never challenged that these files are protected by copyright. "Source and object code, the literal components of a program, are consistently held protected by a copyright on the program." *Johnson Controls, Inc. v. Phoenix Control Systems, Inc.*, 886 F.2d 1173, 1175 (9th Cir. 1989).

Accordingly, at the conclusion of the evidentiary phase of the trial, Oracle will ask the Court to instruct the jury that the 37 core API design specifications and the 12 source code files that Google copied are protected by copyright. The Court should also instruct the jury on the scope of protection to be afforded to the copyrighted works – in this case, substantial similarity – and the frame of reference for comparing the copyrighted works to the infringing workswithin which they should be compared.

Because Google does not deny access or copying, a finding that the APIs (and source code) are protected by copyright leads to a determination of copyright infringement, and the main issues for the jury to decideleaving will be Google's affirmative defenses and , willfulness and damages for the jury to decide in the liability phase. The Court and the jury should hear this evidence at the same time, because it will overlap almost completely, and will involve the same

fact and witness testimony and documentsation. As part of Google's fair use defense, which the Court has already held raises factual issues that were not appropriate for determination on summary judgment (9/15/11 Summary Judgment Order (Dkt. 433) at 13), the jury must consider the "nature of the copyrighted work," the "purpose and character of the use" and the "amount and substantiality of the portion used in relation to the work as a whole." *Id.* (quoting 17 U.S.C. § 107). Google expressly raises the issue of compatibility in the context of both copyrightability and fair use. Google's Motion for Summary Judgement (Dkt. 260) at 21. The jury and the Court will need to hear testimony from the same fact witnesses who were involved in designing these APIs and Google's APIs to determine the amount of creativity involved in their design and their expressive nature. The jury will also need to understand this as well to determine both damages and the fourth fair use factor, the "effect of the use on the potential market for or value of the work as a whole." *Id.*

At the conclusion of the evidence, the Court should instruct the jury on its findings of copyrightability so that they can apply those findings in reaching their verdict. *See Pivot Point Int'l, Inc. v. Charlene Prods., Inc.*, 932 F. Supp. 220, 225 (N.D. Ill. 1996) (Easterbrook, C.J., sitting by designation) (,"[i]f the court determines that mannequin heads are copyrightable subject matter, the jury will be so instructed").

B. Google's Equitable Defenses of Laches, Equitable Estoppel, Waiver, and Implied License

Google is asserting laches, equitable estoppel, waiver, and implied license as defenses to Oracle's claims of copyright and patent infringement. As set forth in the Joint Proposed Pretrial Order (Dkt. 525 at 10, 12), the parties agree that these issues should be resolved by the Court. But Google has nonetheless proposed that instructions be given to the jury on these defenses. There is no reason the jury should be asked to opine on these issues, when the parties already agree and the law is clear that the Court decides these defenses.

Laches, equitable estoppel, waiver, and implied license are equitable defenses to be decided by courts, not juries. *A.C. Aukerman Co. v. RL Chaides Constr. Co.*, 960 F.2d 1020, 1028 (Fed. Cir. 1992) (en banc) ("As equitable defenses, laches and equitable estoppel are matters

committed to the sound discretion of the trial judge"); *Qualcomm Inc. v. Broadcom Corp.*, 548 F.3d 1004, 1019 (Fed. Cir. 2008) (reviewing "a district court's judgment on the equitable defense of waiver for an abuse of discretion").

The Ninth Circuit has held that "[a] litigant is not entitled to have a jury resolve a disputed affirmative defense if the defense is equitable in nature." *Granite States Ins. Co. v. Smart Modular Techs. Inc.*, 76 F.3d 1023, 1027 (9th Cir. 1996). Equitable issues may be submitted to a jury with the consent of both parties, but Oracle does not so consent. *See* Fed. R. Civ. P. 39(c); *Wang Labs., Inc. v. Mitsubishi Elecs. Am., Inc.*, 103 F.3d 1571, 1578 (Fed. Cir. 1997) ("The parties agreed to submit Mitsubishi's implied license defense to the jury and the jury found an implied license to exist.").

C. Injunction Against Android Platform

Oracle pursues injunctive relief to prevent Google from further fragmenting the Java platform and thereby undermining Oracle's and others' investments in Java's "write once, run anywhere" promise. To prove that it is entitled to an injunction order against Google, Oracle must show that: (1) it has suffered an irreparable injury; (2) remedies available at law, such as monetary damages, are inadequate to compensate for that injury; (3) balancing of hardships between Oracle and Google weighs in favor of the injunction; and (4) the public interest would not be disserved by a permanent injunction. *eBay Inc. v. MercExchange, LLC*, 547 U.S. 388, 391 (2006) (citations omitted). Injunction is an equitable remedy to be decided by the Court. *Id.* at 394.

Oracle will show that both the equities and the public interest require an injunction preventing Google from making, using, and distributing unauthorized, non-Java-compliant versions of the Android platform containing the copyrighted code and documentation and patented technology. Google's infringement and the resulting fragmentation to Java evidence a clear case of irreparable injury. Oracle practices the copyrights-in-suit and the six Java-related

¹ Oracle will forego its injunction request only if Google commits in writing, in a form prescribed by Oracle, to ensure that Android will be Java-compatible and comply with all applicable Java licensing and payment conditions.

Case 3:10-cv-03561-WHA Document 568 Filed 10/27/11 Page 33 of 34

patents, and has strived to keep the "write once, run anywhere" promise of the Java platform.
Android's incompatible forking of Java has caused irreparable injury to Oracle, and monetary
damages are inadequate to compensate Oracle for the injury Android has caused to the value of
the Java platform. An injunction is necessary to prevent Google from further fragmenting the
Java platform and undermining Oracle's and others' investments in Java. Furthermore, as a result
of Google's infringement, Oracle will continue to lose share in the market for mobile platforms,
as it has already lost significant sales for Java ME. i4i Ltd. Partnership v. Microsoft Corp., 598
F.3d 831, 861 (Fed. Cir. 2010). Android will continue to draw application developers away from
Java and will score significant design wins as a result. Amazon's recent decision to make its
Kindle e-reader an Android device, for example, illustrates that Android has caused and will
cause further irreparable harm to Oracle. Broadcom Corp. v. Qualcomm Inc., 543 F.3d 683, 702-
03 (Fed. Cir. 2008). Oracle practices the patents and copyrights-in-suit, and has strived to keep
the "write once, run anywhere" promise of the Java platform. Android's incompatible forking of
Java has caused irreparable injury to Oracle, and monetary damages are inadequate to
compensate Oracle for this injury. An injunction is necessary to prevent Google from further
fragmenting the Java platform and undermining Oracle's and others' investments in Java.
Oracle anticipates that its request for an injunction will be decided by the Court based on
evidence presented during trial as well as additional evidence presented through a hearing

evidence presented during trial as well as additional evidence presented through a hearing following at least the trial on liability.
